

KALMATRON KF-C

KALMATRON®KF-C is a fast hardening plug compound for stopping pressured leaks in concrete, wooden, and masonry structures. • **KF-C** plugs leaks with pressures up to 19 Bar. It is applicable in underwater conditions with the use of **KF-C** plugs or pressured strewing of **KF-C** powder by compressor. The controlled set time is 10 to 15 minutes for a ratio of 4 to 1 of **KF-C** powder to water by volumes. Any set time can be controlled by varying the KF-C powder to water ratio.

Glassy-solid KF-C patch stops any leak forever.

Hand made "Hot Patch" stops a pressured leak in 30 seconds even in powder form.

Hardened plugs of KF-C are the best way to detain water before final application.

"Welding of Concrete" with KF-C stops any leaks and resurfaces concrete defects.
